Primary Examiner — Yosef Kassa

(57) **ABSTRACT**

Digital image data including discrete photographic images of a variety of different subjects, times, and so forth, are collected and analyzed to identify specific features in the photographs. In an embodiment of the invention, distinctive markers are distributed to aid in the identification of particular subject matter. Facial recognition may also be employed. The digital image data is maintained in a database and queried in response to search requests. The search requests include criteria specifying any feature category or other identifying information, such as date, time, and location that each photograph was taken, associated with each photograph. Candidate images are provided for review by requesters, who may select desired images for purchase or downloading.

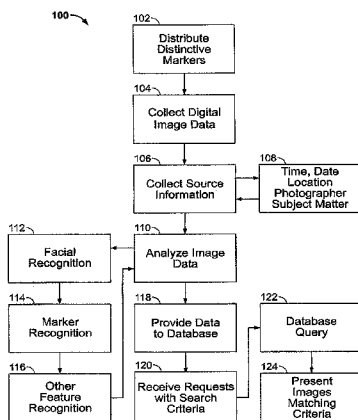

FIG. 1

FIG. 2

METHOD AND APPARATUS FOR PHOTOGRAPH FINDING

CROSS-REFERENCE TO RELATED APPLICATIONS

The present application is a continuation of U.S. application Ser. No. 13/090,026, filed Apr. 19, 2011, which is a continuation of Ser. No. 12/874,929, filed Sep. 2, 2010 (now U.S. Pat. No. 7,929,810), which is a continuation of Ser. No. 12/325,589, filed Dec. 1, 2008 (now U.S. Pat. No. 7,844,141), which is a continuation of Ser. No. 11/056,699, filed Feb. 10, 2005 (now U.S. Pat. No. 7,460,737), which claims priority to U.S. Provisional Appl. No. 60/544,570, filed Feb. 12, 2004; the disclosures of each of the above-referenced applications are incorporated by reference herein in their entireties.

BACKGROUND OF THE INVENTION

Field of the Invention

Photography has transformed how people conceive of the world. Photographs allow people to see all sorts of things that are actually many miles away and/or years preceding. Photography lets people capture moments in time and preserve them for years to come.

Often people at a public place notice that a stranger has taken a photograph of which they would love to have a copy. Alternatively, after going somewhere, a person may bemoan the fact that he did not have a photograph of the event (in the present context, photograph also includes video, audio, or other representation).

A need exists, therefore, to provide a method and apparatus for identifying and connecting people with photographs they want. In addition, there is a need to provide a method and apparatus for characterizing errant photographs stored on computer databases that makes use of a variety of attributes to reliably characterize photographs in such a way as to reduce the amount of manual review necessary to identify and connect people with the photographs they want.

SUMMARY OF THE INVENTION

The present invention provides a method and apparatus that matches people with photographs in which they accidentally (or purposely) appear or with photographs of events they have attended.

Specifically, in one embodiment, a web site is created with a database backend. The database is seeded with information provided by (1) the photographer; (2) recovering metadata from the photograph; (3) reading devices such as a Global Positioning System (GPS) device; (4) referencing the account data of the photographer (i.e., account number, photographer's zip code or area code, etc.); (5) analyzing the photograph (i.e., computer recognizes eye color, optical character recognizes any text found in the photograph, recognizes the number of persons, the gender of persons, the hair color, the time of day by optical character recognizing any clocks in the photograph or analyzing the lighting conditions, the weather, etc.); (6) photograph quality information; and/or (7) any other information.

A user looking for a photograph would visit the web site and search for certain criteria. The user is then provided with a gallery of thumbnails that match the criteria. When the user identifies a photograph he wants to own, he can then download the full quality version, or order print(s). In a preferred implementation, the user is charged some amount of money

that is split between the site owner and the photographer. Alternatively, the user may be charged in some other way, such as by viewing advertisements or by exchanging credits for downloads or by some other payment or a combination thereof.

A more complete understanding of the present invention will be afforded to those skilled in the art, as well as a realization of additional advantages and objects thereof, by a consideration of the following detailed description of the preferred embodiments.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a flow diagram showing exemplary steps of a method according to the invention.

FIG. 2 is a diagram showing an exemplary distinctive marker for photographic data.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The present invention provides a method and apparatus that matches people with photographs in which they accidentally (or purposely) appear or with photographs of events they have attended.

FIG. 1 illustrates exemplary steps of a method 100 according to the invention. At optional step 102, distinctive markers may be distributed to persons desiring to contribute photographic images to a database. The markers may comprise, for example, distinctive bins, badges, or stickers for placing on objects to be photographed. The markers should be designed so as to be easily recognized using automatic recognition algorithms, but should not be too conspicuous.

At step 104, image data is collected from a variety of sources. It may be desirable to accept material from as many sources as possible, to increase the number of images available for browsing. Optionally, images may be accepted from qualified sources only.

At step 104, source information regarding each photograph is collected. For example, at step 108, the image provider may be asked for information, such as the time and date of the photograph, the subject matter, location, photographer, etc. Image metadata may also be read to obtain such information. Other ways of associating images to identifying information may include, for example, reading devices such as a Global Positioning System (GPS) device attached to a camera or other image capture device, or by referencing account data of the image contributor (e.g., account number, photographer's zip code or area code, etc.).

At step 110, image data is analyzed to identify any characteristics that may be of interest to users. Such characteristics may include, for example, eye color, words and sentences, a number or gender of persons, the hair color, time of day, lighting conditions, and so forth. For further example, at step 112, a facial recognition program as known in the art may be used to analyze any faces appearing in the photos at a sufficiently high resolution. At step 114, the images may be analyzed for the presence of any known markers. And at step 116, other features and qualities of the image may be classified, for example, whether it is taken indoors or outdoors, whether it contains people, dogs, cats, or other animals, whether it contains automobiles, airplanes, or other objects, and so forth. At step 118, selected feature information and other source information is associated with each image and provided to any suitable relational database.

At step 120, requests specifying search criteria for photographic images are received. For example, a user looking for

a photograph may visit a web site hosted by the system and fill out a search form specifying search criteria of interest. The criteria may include specific subject matter, times, dates, and locations. For example, "Disneyland AND Matterhorn AND blue eye AND child AND Jan. 1, 2004 AND morning" would search for a photograph or photographs taken at Disneyland's Matterhorn with a child who has blue eyes on the morning of Jan. 1, 2004.

At step 122, the image database is queried as known in the art, to identify images that at least partially match the search criteria. Such images may be presented, at step 124, to the user. For example, the user may be provided with a gallery of "thumbnail" (reduced-size) images generated from images that match the criteria. When the user identifies a photograph he wants to own, he can then download the full quality version, or order print(s). In a preferred implementation, the user is charged some amount of money that is split between the site owner and the photographer. Alternatively, the user may be charged in some other ways such as by viewing advertisements or by exchanging credits for downloads or by some other payment or a combination thereof. The price can be on a sliding scale depending on the quality of the photograph that the user downloads or the size or quality of the print. For example, a photograph may cost \$1.00 for 1024×768 resolution or \$2.00 for 1600×1200 resolution. Similarly, a print may cost \$1.00 for 3×5 or \$5 for 8×10. For downloads, an "upgrade" may be possible by charging the difference between the resolutions. An automated process may be used to reduce the number of pixels for purposes of having a lower quality version to sell.

In addition, a surcharge may be applied (even if no surcharge is required) for various enhancements to the photograph, such as "upconverting" to a higher resolution, eliminating red-eye, enhancing shadow, color, or brightness, etc.

Moreover, when a photographer takes photographs, he can be provided with printed cards bearing a Uniform Resource Locator (URL) and a unique code in order that the user would be able to enter into the web site to find the photograph or the series of photographs then being taken. The photographer can also distribute cards (the printed cards bearing the URL and the unique code or any other cards known to those skilled in the art) to people whom he photographs, whether intentionally or inadvertently. The photographer can further advertise the same (e.g., the URL and the unique code) via a mark on his camera, a T-shirt, or other means.

Fixed-place cameras can also serve this function (e.g., the of photographer). For example, a camera set up at an intersection in Hollywood might take and upload one photograph every 10 seconds.

Photographers can also be given accounts and be allowed to upload photographs to the site. The database is populated during this process, although additional database information can be added later by web site users. In addition, the number of times the photograph has been purchased and/or viewed can be a part of the database.

In one embodiment, the method and apparatus of the present invention should be capable of face recognition. It should assign values to various factors (i.e., ratio of distance between pupils to distance to tip of nose, etc.). It would add this information to the database for uploaded photographs. A user can then upload a photograph of the target person and the system would then generate the same data from that photograph and use it to limit the possible search targets.

A provider of the present method and apparatus or a photographer can also hand out pins, clothing, or other materials that are marked in a way that allows a computer to later recognize them in a photograph. FIG. 2 shows an exemplary

distinctive marker 200 having an optical code 202, such as a bar code. The marker may have a color combination, distinctive shape, lettering, bar code, or other optical pattern, or some combination of the foregoing, that is unique to the marker. The marker may be computer generated, for example, and produced using an end-user's laser or ink-jet printer. The marker may be associated with specific information, for example, a particular user account, photographer, subject matter type, person, event, or location. Users can later search for photographs containing an image of the marker.

Numerous distribution mechanisms exist whereby photographs may be distributed from a source over a wide area network, such as the Internet. In some cases, the photographs are distributed using a centralized server system (such as Napster 2.0, eBay, or from a web site). In other cases, the photographs are distributed using a decentralized system (such as Gnutella). In a preferred implementation, the photographs are distributed to a person using the centralized server system or using a central hub.

Embodiments of the present invention operate in accordance with at least one web-hosting mechanism and a plurality of user mechanisms communicating over a wide area network, such as the Internet. Specifically, a web-hosting mechanism includes a database, an interface application and a server, wherein the server is adapted to communicate with a plurality of user mechanisms over a wide area network. It should be appreciated that the mechanisms described can include, but are not limited to, personal computers, mainframe computers, personal digital assistants, wireless communication devices and all other physical and wireless connected network devices generally known to those skilled in the art. It should further be understood that the database depicted can include, but is not limited, to RAM, cache memory, flash memory, magnetic disks, optical disks, removable disks, SCSI disks, IDE hard drives, tape drives, and all other types of data storage devices (and combinations thereof, such as RAID devices) generally known to those skilled in the art. In addition, the mechanisms described above are for purposes of example only and the invention is not limited thereby.

Having thus described several embodiments for photograph finding, it should be apparent to those skilled in the art that certain advantages of the system have been achieved. It should also be appreciated that various modifications, adaptations, and alternative embodiments thereof may be made within the scope and spirit of the present invention. For example, in the context of the present invention a photograph can include video, audio, and/or other representation of how people conceive of the world. The invention is defined by the following claims.

What is claimed is:

1. A method implemented by a computer system including computer hardware, the method comprising:
 - receiving, at a web site, a first digital image selected by a user of the web site;
 - receiving, from a facial recognition process, first information that represents at least one facial feature appearing within the first digital image;
 - comparing the first information to at least second information that represents at least a second facial feature appearing within at least a second digital image;
 - based on the comparing, identifying at least the second digital image from among a plurality of digital images; and
 - causing presentation of at least the second digital image to the user via the web site, wherein the presentation iden-

5

tifies at least one target person having facial features that at least partially match the first information.

2. The method of claim 1, further comprising: receiving, from a facial recognition process, the second information.

3. The method of claim 1, further comprising: performing the facial recognition process.

4. The method of claim 1, further comprising: analyzing the first digital image to generate the first information.

5. The method of claim 1, further comprising: analyzing the second digital image to generate the second information.

6. The method of claim 1, wherein the second digital image is submitted by another user of the web site.

7. The method of claim 1, wherein causing presentation of at least the second digital image to the user via the web site includes causing the web site to present at least the second digital image to the user via a personal computer.

8. The method of claim 1, wherein causing presentation of at least the second digital image to the user via the web site includes causing the web site to present at least the second digital image to the user via a wireless connected network device.

9. The method of claim 1, wherein comparing the first information includes comparing the first information to second information that is generated from the second digital image before the first information is received from the facial recognition process.

10. A method implemented by a computer system including computer hardware, the method comprising: storing a first digital image uploaded via a web browser to a web site, wherein the first digital image contains a visual representation of at least a first human facial feature; receiving, from a facial recognition process, first information that represents the first human facial feature; storing a second digital image that contains a visual representation of at least a second human facial feature; receiving, from the facial recognition process, second information that represents the second human facial feature; comparing the first information to at least the second information; based on the comparing, identifying at least the second digital image from among a plurality of digital images; and causing presentation of at least the second digital image via the web site, wherein the presentation identifies at least one target person having facial features that at least partially match the first information.

11. The method of claim 10, further comprising: performing the facial recognition process.

12. The method of claim 10, further comprising: analyzing the first digital image to generate the first information.

13. The method of claim 10, further comprising: analyzing the second digital image to generate the second information.

14. The method of claim 10, wherein causing presentation of at least the second digital image via the web site includes causing a presentation of a web page that identifies the at least one target person.

15. The method of claim 10, wherein causing presentation of at least the second digital image via the web site includes causing a presentation of a universal resource locator (URL) indicative of the second digital image.

6

16. A method, comprising: a computer system receiving a first image selected by a user of a web site, wherein the first image depicts at least a first face;

5 the computer system comparing facial recognition information for the first face with facial recognition information for faces in a plurality of images, wherein the plurality of images includes a second image depicting at least a second face;

10 based on the comparing, the computer system determining that a match exists between the first face and the second face.

17. The method of claim 16, further comprising: in response to the determining, the computer system providing an indication of the match to the user via the web site.

18. The method of claim 17, wherein the indication includes presentation of a web page that includes the second image.

19. The method of claim 17, wherein the indication includes presentation of a thumbnail version of the second image.

20. The method of claim 16, further comprising: the computer system performing a facial recognition process that extracts the facial recognition information for the first face from the first image.

21. The method of claim 16, wherein the facial recognition information for the first face includes information indicative of distances between facial features.

22. The method of claim 16, further comprising: the computer system storing location information identifying where the second image was taken.

23. The method of claim 16, further comprising: the computer system storing a value indicative of a number of times that the second image has been viewed.

24. A method, comprising: a computer system receiving an image uploaded via a web browser to a web site; and in response to receiving the uploaded image, the computer system searching a data store to determine whether a face depicted in the uploaded image is present within one or more other images stored in the data store.

25. The method of claim 24, wherein the searching includes the computer system comparing facial recognition information for the uploaded image to facial recognition information for other images present in the data store.

26. The method of claim 24, further comprising: in response to the searching, determining that a match exists between the face depicted in the uploaded image and a face depicted in at least one other image in the data store, the computer system providing an electronic page with information indicative of the at least one other image.

27. The method of claim 26, wherein the information indicative of the at least one other image is a thumbnail image.

28. The method of claim 25, further comprising: the computer system storing the uploaded image in the data store along with the facial recognition information for the uploaded image.

29. The method of claim 25, further comprising: the computer system performing a facial recognition process to determine the facial recognition information for the uploaded image.
